Principal Investigators: Prof. Jo Van Dorpe (MD, PhD), Prof. Björn Menten (PhD) and Prof. Katleen De Preter (PhD)

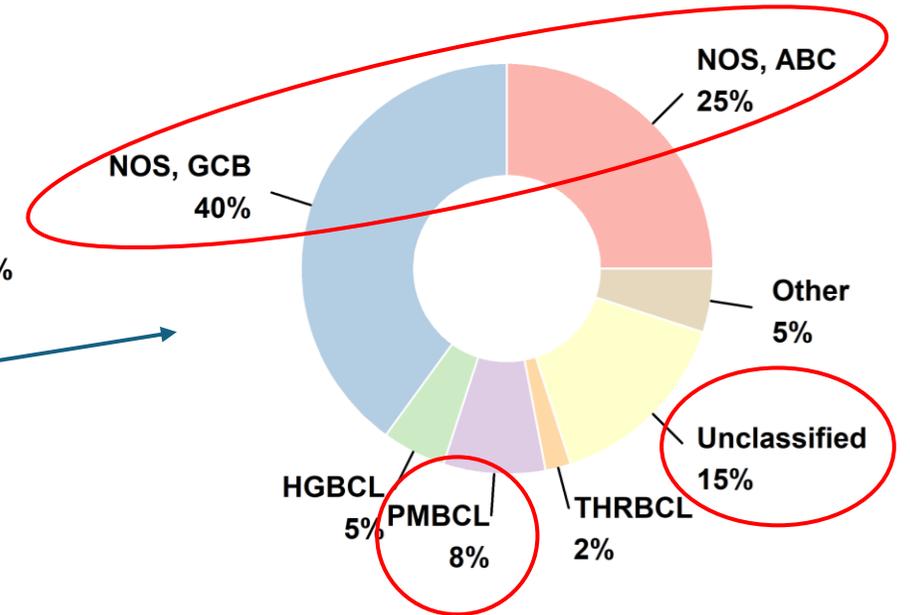

All lymphomas

NHL subtypes

DLBCL subtypes

- **Historic CNV-based classifier:**

- "Capable" of classifying ~40% of major lymphoma cases (optimistic estimate)
- DLBCL alone is highly heterogeneous with plenty of subtypes based on genetics and COO

- Are the subtypes not covered by the model relevant? **Yes!**

- **GCB vs. ABC:** GCB generally better survival and may respond differently to targeted treatments
- **DLBCL vs. FL:** FL is indolent but can transform into DLBCL, affecting treatment planning
- **HGBCL vs. DLBCL, NOS:** HGBCL is more aggressive with poorer outcomes and often requires intensified chemotherapy

*Methylation profiling > CNVs
(for accurate cancer subtyping)*

1. Cell identity & state

Methylation: cell of origin & differentiation

CNVs: minimal insight into regulatory programs

2. Stability

Methylation: signal remains stable in cfDNA

CNVs: can be noisy or variable, subclonality

3. Subtype specificity

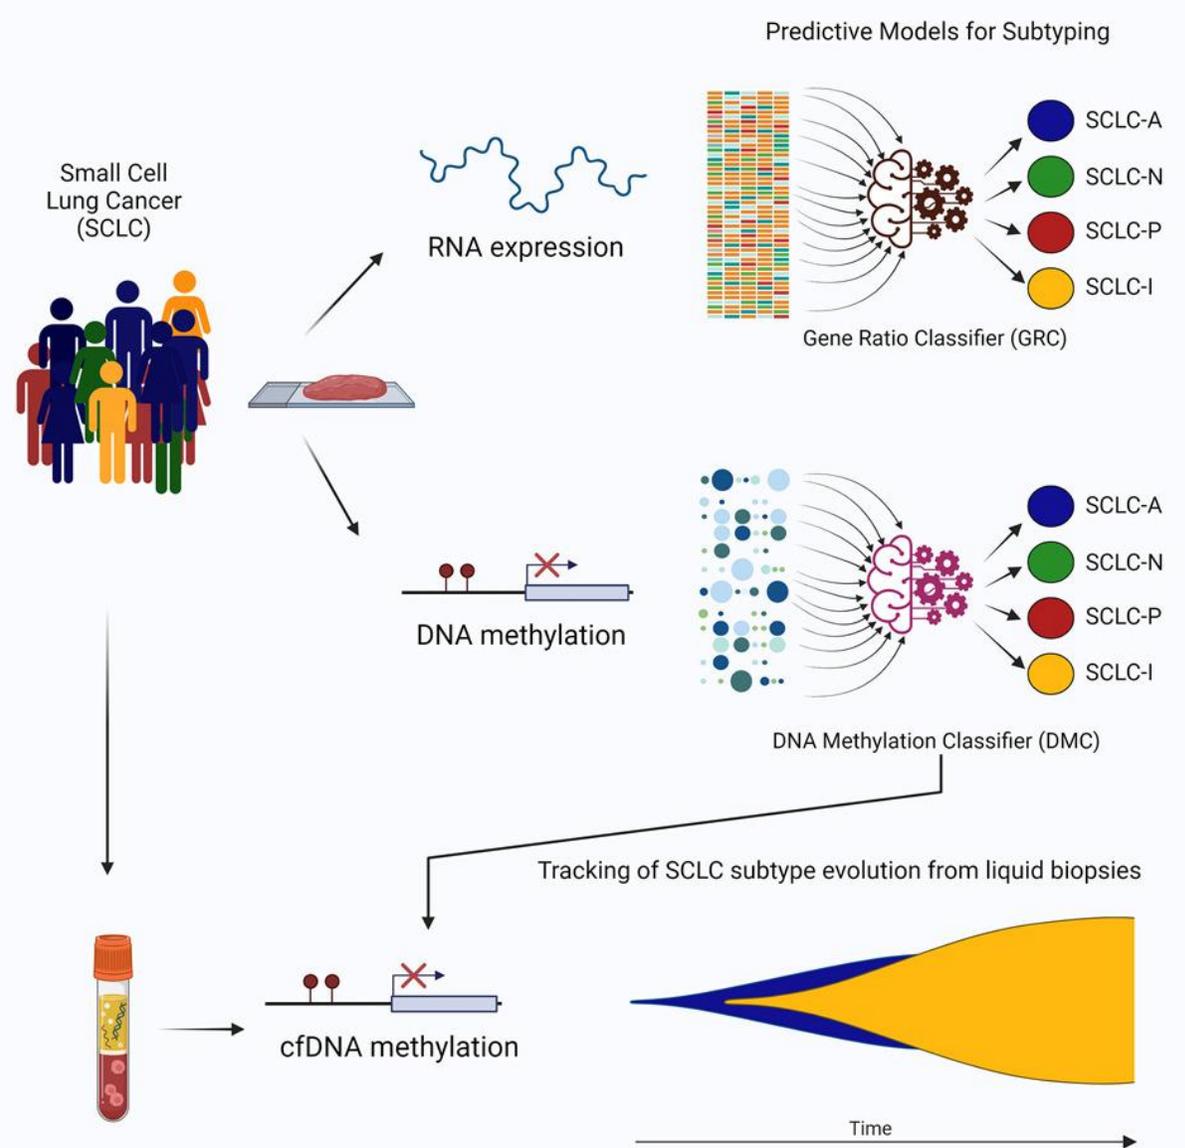

Methylation: locus-specific

CNVs: genome-wide instability

4. Comprehensiveness

Methylation: CpGs + CNA

CNVs: Only CNA

Clinical adoption + cfDNA → trade-off of cost, reproducibility, and handling fragmented input!

Platform	Type	Pro	cfDNA Limitation
WGBS	Genome-wide, bisulfite	Full genome coverage	High input, DNA loss
RRBS	CpG-enriched, bisulfite	Low cost, CpG focus	Fragmentation, poor enrichment
EM-seq	Enzymatic conversion	Preserves DNA, low input	Needs optimization
Illumina EPIC	Array, bisulfite	High throughput, robust	Limited sites, high input
Nanopore	Direct, long-read	Native methylation	Low accuracy, fragmented cfDNA

6. Bisulfite conversion

7. PCR amplification

	WGBS	cf-RRBS
Coverage	~90–95% of CpGs genome-wide	~5–10% of CpGs, focused on CpG-rich regions
Input DNA requirement	Typically ≥ 100 ng	Optimized for very low input (~1–10 ng)
Cost per sample	~€1,500–€2,500	~€200–€500
Sequencing depth requirement	Very high (10^8 reads for adequate coverage)	Moderate (10^7 reads)
Bias	Suffers from bisulfite conversion errors and GC-bias	Selection bias: only CpG-dense regions are interrogated
